

PRAWNS

Early testing and experimentation indicate Orykta® may provide major breakthroughs in aquaculture. It has also been noted that prawns and fish alike readily feed directly on Orykta®.

Tests performed in Sabah, East Malaysia, showed that when Orykta® was introduced to pond water:

- Algae and ammonia buildup was reduced.
- Pond water remained clear.
- Desired pH levels were better maintained.
- The need for water replacement was reduced significantly.

and...

- Prawns appeared more active and healthier.
- Plankton growth increased.
- Prawns had better shell structure.
- Prawns reached market size an average of two weeks early.

A Cure for White Spot Disease?

White Spot Disease is a shrimp disorder that can wipe out an entire harvest. Orykta® may be the long sought after cure for this devastating shrimp disorder. Reports from the field are that no shrimp ponds that have had Orykta® added to them were stricken by the deadly White Spot Disease, while adjacent ponds not treated with Orykta® were desecrated by the disease. In practice, growers report that a single application of Orykta® is sufficient for one growing season with no additional remedying substances needed.
